AMENDMENT TO CLAIMS

- 1. (Currently amended) A non-volatile memory comprising:
- a first electrode;
- a second electrode; and
- a phase-change recording medium sandwiched between the first electrode and the second electrode, in which resistance value is varied by application of an electrical pulse across the first electrode and the second electrode; wherein
- at teast one of the first electrode and the second electrode contains <u>nuthentum</u> as a main ingredient at loss one-member selected from the group consisting of nuthentum, the dium and esmium; and

the phase-change recording medium is formed of GeSbTo ((from a phase-change material containing chalcogen(s))).

- 4. (Original) A non-volatile memory according to claim 1, wherein
 an insulating layer lies between the first electrode and the second electrode;
 the insulating layer comprises a throughhole; and
 the phase-change recording medium comprises a standing portion filling the throughhole.
- (Original) A non-volatile memory according to claim 4, wherein the standing
 portion has a straight tube shape.

Application/Control Number: 10/716,621

Art Unit: 2800

6. (Original) A non-volatile memory according to claim 4, wherein the phase-change recording medium further comprises a layered portion sandwished between the insulating layer and either the first electrode or the second electrode; and the standing portion is formed so as to extend from the layered portion in a substantially perpendicular direction.

- 7. (Original) A non-volatile memory according to claim 4, which further comprises an insulating tube that is formed along the inner surface of the throughhole and that has a thermal conductivity lower than that of the insulating layer.
- 8. (Original) A non-volatite memory according to Claim 1, wherein a metal-oxide layer containing at least one member selected from the group consisting of ruthenium, shodium iridium and osmium lies between at least one of the pairs of the first electrode and the phase-change recording medium, and the phase-change recording medium and the second electrode.
- Original) A non-volatile memory according to claim 8, wherein a rough surface
 is provided on the metal-oxide tayer in the region where it comes into contact with the phasechange recording medium.
- 10. (Original) A non-volatile memory according to claim 9, wherein the surface where the metal-oxide layer comes into contact with the phase-change recording medium has an average roughness (Ra) of from not smaller than 10 nm to not greater than 100 nm.

Application/Control Number: 10/716,621

Art Unit: 2800

11. (Original) A non-volatile memory according to claim 9, wherein
the metal-oxide layer has a multi-layered structure comprising a first conductive oxide
film that has a small average grain size or that is amorphous and a second conductive oxide film
that has an average grain size greater than that of the first conductive oxide film; and

the surface of the second oxide conductive film is structured so as to contact with the phase-change recording medium.

- 12. (Original) A non-volatile memory according to Claim 8, wherein the metal-oxide layer is a conductive oxide layer having a tetragonal rutile structure.
- 13. (Original) A non-volatile memory according to Claim 1, which further comprises a substrate and an insulating layer formed on the substrate, wherein

the insulating layer comprises a throughhole;

the first electrode fills in the throughhole; and

the phase-change recording medium forms a layered structure on the surface of the insulating layer.

14. (Original) A non-volatile memory seconding to Claim 13, wherein a metal-oxide layer containing at least one member selected from the group consisting of rathenium, chodium iridium and osmium lies between at least one of the pairs of the first electrode and the phase-change recording medium, and the phase-change recording medium and the second electrode.

Application/Control Number: 10/716,621

Art Unit: 2800

15. (Original) A non-volatile memory according to Claim 14, wherein a rough surface is provided on the metal-oxide layer in the region where it comes into contact with the phase-change recording medium.

- 16. (Original) A non-volatile memory according to Claim 15, wherein the surface region where the metal-oxide layer comes into contact with the phase-change recording medium has an average roughness (Ra) not smaller than 10 nm to not greater than 100 nm.
- 17. (Original) A non-volatile memory according to Clalm 15, wherein
 the metal-exide layer has a multi-layered structure comprising a first exide conductive
 film that has a small everage grain size or that is amorphous and a second exide conductive film
 that has an average grain size greater than that of the first exide conductive film; and

the surface of the second oxide conductive film is structured so as to contact with the phase-change recording medium.

18. (Original) A non-volutile memory according to Claim 13, which further comprises an insulating tube that is formed along the inner surface of the throughhole and that has a thermal conductivity lower than that of the insulating layer.

BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images include but are not limited to the items checked:

□ BLACK BORDERS
 □ IMAGE CUT OFF AT TOP, BOTTOM OR SIDES
 □ FADED TEXT OR DRAWING
 □ BLURRED OR ILLEGIBLE TEXT OR DRAWING
 □ SKEWED/SLANTED IMAGES
 □ COLOR OR BLACK AND WHITE PHOTOGRAPHS
 □ GRAY SCALE DOCUMENTS
 □ LINES OR MARKS ON ORIGINAL DOCUMENT

IMAGES ARE BEST AVAILABLE COPY.
